## **Overview**

The Swift Navigation Binary Protocol (SBP) is a fast, simple, and minimal binary protocol for communicating with Swift devices. It is the native binary protocol used by the Piksi GPS receiver to transmit solutions, observations, status, and debugging messages, as well as receive messages from the host operating system, such as differential corrections and the almanac. As such, it is an important interface with your Piksi receiver and the primary integration method with other systems.

This document provides a specification of SBP framing and the payload structures of the messages currently used with Swift devices. SBP client libraries in a variety of programming languages are available at <a href="http://docs.swiftnav.com/wiki/SwiftNav\_Binary\_Protocol">http://docs.swiftnav.com/wiki/SwiftNav\_Binary\_Protocol</a>.

# **Message Framing Structure**

SBP consists of two pieces:

- an over-the-wire message framing format
- structured payload definitions

As of Version 2.3.16, the frame consists of a 6-byte binary header section, a variable-sized payload field, and a 16-bit CRC value. All multibyte values are ordered in **little-endian** format. SBP uses the CCITT CRC16 (XMODEM implementation) for error detection<sup>1</sup>.

Offset (bytes)	Size (bytes)	Name	Description
0	1	Preamble	Denotes the start of frame transmission. Always 0x55.
1	2	Message Type	Identifies the payload contents.
3	2	Sender	A unique identifier of the sender. On the Piksi, this is set to the 2 least significant bytes of the device serial number. A stream of SBP messages may also include sender IDs for forwarded messages. By default, clients of 'libsbp' use a sender id value of '0x42'. Sender id '0x42' is used to represent device controllers such as the Piksi Console.
5	1	Length	Length (bytes) of the Payload field.
6	Ν	Payload	Binary message contents.
N + 6	2	CRC	Cyclic Redundancy Check of the frame's binary data from the Message Type up to the end of Payload (does not include the Preamble).
	N + 8		Total Frame Length

## **NMEA-0183**

Swift devices, such as the Piksi, also have limited support for the standard NMEA-0183 protocol.

Note that NMEA-0183 doesn't define standardized message string equivalents for many important SBP messages such as observations, baselines and ephemerides. For this reason it is strongly recommended to use SBP for new development. NMEA-0183 output is provided primarily to support legacy devices.

 $<sup>^1</sup>$ CCITT 16-bit CRC Implementation uses parameters used by XMODEM, i.e. the polynomial:  $x^{16} + x^{12} + x^5 + 1$ . For more details, please see the implementation at https://github.com/swift-nav/libsbp/blob/master/c/src/edc.c#L59. # **Basic Formats and Payload Structure**

The binary payload of an SBP message decodes into structured data based on the message type defined in the header. SBP uses several primitive numerical and collection types for defining payload contents.

Name	Size (bytes)	Description	
s8	1	Signed 8-bit integer	
s16	2	Signed 16-bit integer	
s32	4	Signed 32-bit integer	
s64	8	Signed 64-bit integer	
u8	1	Unsigned 8-bit integer	
u16	2	Unsigned 16-bit integer	
u32	4	Unsigned 32-bit integer	
u64	8	Unsigned 64-bit integer	
float	4	Single-precision float (IEEE-754)	
double	8	Double-precision float (IEEE-754)	
array	_	Fixed or variable length array of any fill type	
string	_	Fixed or variable length string (NULL padded/terminated)	
bitfield	_	A primitive type, typically a u8, can encode boolean and enumerated status flags.

#### **Example Message**

As an example, consider this framed series of bytes read from a serial port:

55 02 02 cc 04 14 70 3d d0 18 cf ef ff ff ef e8 ff ff f0 18 00 00 00 00 05 00 43 94

This byte array decodes into a MSG\_BASELINE\_ECEF (see pg. 16), which reports the baseline position solution of the rover receiver relative to the base station receiver in Earth Centered Earth Fixed (ECEF) coordinates. The segments of this byte array and its contents break down as follows:

Field Name	Туре	Value	Bytestring Segment

# **Message Types**

Packages define a logical collection of SBP messages. The contents and layout of messages in packages marked **stable** are unlikely to change in the future. **Draft** messages *will change with future development* and are detailed purely for *informational purposes only*. Many draft messages are implementation-defined, and some collections, such as the acquisition package, are used for internal development.

# **Stable Message Definitions**

## **Ext Events**

Messages reporting accurately-timestamped external events, e.g. camera shutter time.

#### $MSG\_EXT\_EVENT - 0x0101 - 257$

Reports detection of an external event, the GPS time it occurred, which pin it was and whether it was rising or falling.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	2	u16	weeks	wn	GPS week number
2	4	u32	ms	tow	GPS time of week rounded to the nearest millisecond
6	4	s32	ns	ns_residual	Nanosecond residual of millisecond-rounded TOW (ranges from -500000 to 500000)
10	1	u8		flags	Flags
11	1	u8		pin	Pin number. $09 = DEBUG09$ .

#### **Imu**

Inertial Measurement Unit (IMU) messages.

#### $MSG_IMU_RAW - 0x0900 - 2304$

Raw data from the Inertial Measurement Unit, containing accelerometer and gyroscope readings. The sense of the measurements are to be aligned with the indications on the device itself.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	4	u32	ms	tow	Milliseconds since start of GPS week. If the high bit is set, the time is unknown or invalid.
4	1	u8	ms / 256	towf	Milliseconds since start of GPS week, fractional part
5	2	s16		acc_x	Acceleration in the IMU frame X axis
7	2	s16		$acc_y$	Acceleration in the IMU frame Y axis

#### $MSG_IMU_AUX - 0x0901 - 2305$

Auxiliary data specific to a particular IMU. The 'imu\_type' field will always be consistent but the rest of the payload is device specific and depends on the value of 'imu\_type'.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0 1	1 2	u8 s16 u8		imu_type temp imu_conf	IMU type Raw IMU temperature IMU configuration

#### $MSG_FWD - 0x0402 - 1026$

This message provides the ability to forward messages over SBP. This may take the form of wrapping up SBP messages received by Piksi for logging purposes or wrapping another protocol with SBP.

The source identifier indicates from what interface a forwarded stream derived. The protocol identifier identifies what the expected protocol the forwarded msg contains. Protocol 0 represents SBP and the remaining values are implementation defined.

## **Navigation**

Geodetic navigation messages reporting GPS time, position, velocity, and baseline position solutions. For position solutions, these messages define several different position solutions: single-point (SPP), RTK, and pseudo-absolute position solutions.

The SPP is the standalone, absolute GPS position solution using only a single receiver. The RTK solution is the differential GPS solution, which can use either a fixed/integer or floating carrier phase ambiguity. The pseudo-absolute position solution uses a user-provided, well-surveyed base station position (if available) and the RTK solution in tandem.

When the inertial navigation mode indicates that the IMU is used, all messages are reported in the vehicle body frame as defined by device settings. By default, the vehicle body frame is configured to be coincident with the antenna phase center. When there is no inertial navigation, the solution will be reported at the phase center of the antenna.

#### MSG\_GPS\_TIME — 0x0102 — 258

This message reports the GPS time, representing the time since the GPS epoch began on midnight January 6, 1980 UTC. GPS time counts the weeks and seconds of the week. The weeks begin at the Saturday/Sunday transition. GPS week 0 began at the beginning of the GPS time scale.

Within each week number, the GPS time of the week is between between 0 and 604800 seconds (=60\*60\*24\*7). Note that GPS time does not accumulate leap seconds, and as of now, has a small offset from UTC. In a message stream, this message precedes a set of other navigation messages referenced to the same time (but lacking the ns field) and indicates a more precise time of these messages.

#### $MSG_POS_LLH_COV - 0x0211 - 529$

This position solution message reports the absolute geodetic coordinates and the status (single point vs pseudo-absolute RTK) of the position solution as well as the upper triangle of the 3x3 covariance matrix. The position information and Fix Mode flags should follow the MSG\_POS\_LLH message. Since the covariance matrix is computed in the local-level North, East, Down frame, the covariance terms follow with that convention. Thus, covariances are reported against the "downward" measurement and care should be taken with the sign convention.

#### MSG\_VEL\_BODY — 0x0213 — 531

This message reports the velocity in the Vehicle Body Frame. By convention, the x-axis should point out the nose of the vehicle and represent the forward direction, while as the y-axis should point out the right hand side of the vehicle. Since this is a right handed system, z should point out the bottom of the vehicle. The orientation and origin of the Vehicle Body Frame are specified via the device settings. The full GPS time is given by the preceding MSG\_GPS\_TIME with the matching time-of-week (tow).

# **Settings**

Messages for reading, writing, and discovering device settings. Settings with a "string" field have multiple values in this field delimited with a null character (the c style null terminator). For instance, when querying the 'firmware\_version' setting in the 'system\_info' section, the following array of characters needs to be sent for the string field in MSG\_SETTINGS\_READ: "system\_info\0firmware\_version\0", where the delimiting null characters are specified with the escape sequence '\0' and all quotation marks should be omitted.

In the message descriptions below, the generic strings SECTION\_SETTING and SETTING are used to refer to the two strings that comprise the identifier of an individual setting. In firmware\_version example above, SECTION\_SETTING is the 'system\_info', and the SETTING portion is 'firmware\_version'.

See the "Software Settings Manual" on support.swiftnav.com for detailed documentation about all settings and sections available for each Swift firmware version. Settings manuals are available for each firmware version at the following link: Piksi Multi Specifications. The latest settings document is also available at the following link: Latest settings document. See lastly settings.py , the open source python command line utility for reading, writing, and saving settings in the piksi\_tools repository on github as a helpful reference and example.

### MSG\_HEARTBEAT — 0xFFFF — 65535

The heartbeat message is sent periodically to inform the host or other attached devices that the system is running. It is used to monitor system malfunctions. It also contains status flags that indicate to the host the status of the system and whether it is operating correctly. Currently, the expected heartbeat interval is 1 sec.

The system error flag is used to indicate that an error has occurred in the system. To determine the source of the error, the remaining error flags should be inspected.

#### File IO

Messages for using device's onboard flash filesystem functionality. This allows data to be stored persistently in the device's program flash with wear-levelling using a simple filesystem interface. The file system interface (CFS) defines an abstract API for reading directories and for reading and writing files.

Note that some of these messages share the same message type ID for both the host request and the device response.

#### MSG FILEIO READ REQ — 0x00A8 — 168

The file read message reads a certain length (up to 255 bytes) from a given offset into a file, and returns the data in a MSG\_FILEIO\_READ\_RESP message where the message length field indicates how many bytes were successfully read. The sequence number in the request will be returned in the response. If the message is invalid, a followup MSG\_PRINT message will print "Invalid fileio read message". A device will only respond to this message when it is received from sender ID 0x42.
